

ALGORITHMIC GENERATION OF PASSWORDS**ABSTRACT**

5 Exemplary embodiments of the present invention include a method for providing a password to an application. Such exemplary embodiments include receiving, from a user, a passkey event uniquely associated with one of a plurality of applications requiring a password, and receiving, from a user, a same master password for access to each of the plurality of applications, applying a hashing algorithm associated with
10 the separate input event to the master password to generate an application specific password, and submitting the application specific password to the application for access by the user. In some embodiments, receiving, from a user, a passkey event uniquely associated with any given one of the plurality of applications includes receiving, from a user, an event created by a user's engaging a keyboard key.
